Log-transformation allows for expressing very small number, which has advantage on modeling disaster probability

9 | Integrating Human Domain Knowledge into Artificial Intelligence for Hybrid Forest Fire Prediction

Future Projection Impact of Population Density

Rapidly decreasing population after 2050, while hotspots keep formed near metropolitan cities

10 | Integrating Human Domain Knowledge into Artificial Intelligence for Hybrid Forest Fire Prediction

Future Projection Impact of Fuel Load (Forest Management)

SSP 5-8.5

Current Management

- Clear-cut of 15,000 ha per year (legal final cutting age)
- Thinning practices at a rate of 30% of AGB across 165,000 ha per year

No Management

- No clear-cut
- No thinning practices

National Management Plan (6th) in the Future

- Clear-cut of 35,000 ha per year
- Thinning practices at a rate of 30% of AGB across 165,000 ha per year

12 | Integrating Human Domain Knowledge into Artificial Intelligence for Hybrid Forest Fire Prediction

Future Projection on Fire Frequency

Peak fire frequency between 2030 and 2050

14 | Integrating Human Domain Knowledge into Artificial Intelligence for Hybrid Forest Fire Prediction

Conclusion

IIASA's FLAM incorporates process-based algorithms for interpreting biophysical and anthropogenic factors affecting forest fires.

FLAM-Net effectively integrates FLAM processes into a machine-learning framework, augmented with additional algorithms tailored to national contexts. i.e. agricultural burning and its seasonal patterns, as well as a diverse range of fire hotspots near metropolitan cities in South Korea.

The optimization of FLAM-Net yields interpretable insights into future fire frequency*, while enhancing its applicability through end-to-end optimization capabilities.

* FLAM includes algorithms for estimating burned area, while FLAM-Net was examined only for frequency.

Thank you.
