Foreword

The investigation of a problem connected to probabilistic risk assessments for industrial plants led us to the need to optimize integrals calculated over sets that depend upon parameters. The problem was developed for two applications of tested and inspected components as an optimal control problem involving nonsmooth state transitions. In solving the optimization problem it is necessary to calculate the derivatives of an integral over a domain depending upon the parameters to be optimized. Up to date the theory of the differentiation these integrals is not fully developed. In the working paper a new general formula for differentiation of such integrals is proposed. These results were used for calculation of sensitivities for risk functions. This approach can have a wide application for the stochastic programming problems.

Comments about these mathematical results are invited.

DIFFERENTIATION FORMULA FOR INTEGRALS OVER SETS GIVEN BY INEQUALITIES

S. Uryas'ev

1 Introduction

The optimization of operational strategies for inspected components[5],[6] can be reduced to optimization of the sum of integrals taken over sets that depend upon the parameters. To date, the theory for differentiation of such integrals is not fully developed. Here, we prove a general formula for the differentiation of an integral over the volume given by many inequalities. A gradient of the integral is represented as a sum of integrals taken over volume and over surface.

Let the function

$$F(x) = \int_{f(x,y) \le 0} p(x,y) \,\mathrm{d}y \tag{1}$$

be defined on the Euclidean space \mathbb{R}^n , where $f: \mathbb{R}^n \times \mathbb{R}^m \to \mathbb{R}^k$ and $p: \mathbb{R}^n \times \mathbb{R}^m \to \mathbb{R}$ are some functions. The inequality $f(x, y) \leq 0$ should be treated as a system of inequalities

$$f_i(x,y) \leq 0 , \quad i=1,\ldots,k .$$

To solve optimization problems containing functions of the form (1), a differentiation formula for function (1) is needed. Stochastic programming problems lead to such functions. For example, let

$$F(x) = P\{f(x,\zeta(\omega)) \le 0\}$$
(2)

be a probability function, where $\zeta(\omega)$ is a random vector in \mathbb{R}^m . The random vector $\zeta(\omega)$ has a probability density p(x, y) that depends on a parameter $x \in \mathbb{R}$.

Differentiation formulae for function (1) in the case of only one inequality (k = 1) are described in the papers of E. Raik [7] and N. Roenko [8]. More general results $(k \ge 1)$ were obtained in the papers of J. Simon (see, for example [9]). Special cases of probability function (2) with normal and gamma distributions have been investigated in the papers of A. Prékopa [3], and A. Prékopa and T. Szantái [4]. In the forthcoming book of G.Ch. Pflug [2] the gradient of the function (1) is represented in a form of a conditional expectation (k = 1). The gradient expressions given in [7], [8] and [9] have the form of surface integrals, and are inconvenient from the computational point of view, since the measure of a surface in \mathbb{R}^m is equal to zero.

In the papers [10], [11] of S. Uryas'ev, another type of formula was considered, where the gradient is an integral over a volume. For some applications this type of formula is more convenient. For example, stochastic quasi-gradient algorithms [1] can be used for the minimization of function (1). Here, we propose the formula for the general case of $k \ge 1$, and the formulae in the papers [7] and [10] are special cases of this general result. Since the gradient of the function (1) is represented in [10] and [11] as an integral over volume, in the case of k = 1, it is clear that this integral can be reduced to an integral over a surface (see [7]). Furthermore, it appears that the gradient of the function (1) can also be represented as a sum of integrals taken over volume and over surface (in the case of $k \ge 1$). This kind of formula is especially convenient for the case when the inequalities $f(x, y) \le 0$ include simple constraints $y_i \ge 0$, $i = 1, \ldots, m$ (see an example at the end of the paper).

2 The General Formula

Let us introduce the following shorthand notations

$$f(x,y) = \begin{pmatrix} f_1(x,y) \\ \vdots \\ f_k(x,y) \end{pmatrix}, \quad f_{1,l}(x,y) = \begin{pmatrix} f_1(x,y) \\ \vdots \\ f_l(x,y) \end{pmatrix}$$
$$\nabla_y f(x,y) = \begin{pmatrix} \frac{\partial f_1(x,y)}{\partial y_1}, & \cdots, & \frac{\partial f_k(x,y)}{\partial y_1} \\ & \vdots \\ \frac{\partial f_1(x,y)}{\partial y_m}, & \cdots, & \frac{\partial f_k(x,y)}{\partial y_m} \end{pmatrix},$$

and

$$\nabla_{\boldsymbol{y}}^{N} f_{\boldsymbol{i}}(\boldsymbol{x}, \boldsymbol{y}) = \nabla_{\boldsymbol{y}} f_{\boldsymbol{i}}(\boldsymbol{x}, \boldsymbol{y}) / ||\nabla_{\boldsymbol{y}} f_{\boldsymbol{i}}(\boldsymbol{x}, \boldsymbol{y})|| \, .$$

A transposed matrix H is denoted by H^T , and the Jacobian of the function f(x, y) is denoted by

,

$$\nabla_{y}^{T} f(x, y) = \begin{pmatrix} \frac{\partial f_{1}(x, y)}{\partial y_{1}}, & \dots, & \frac{\partial f_{1}(x, y)}{\partial y_{m}} \\ & \vdots \\ \frac{\partial f_{k}(x, y)}{\partial y_{1}}, & \dots, & \frac{\partial f_{k}(x, y)}{\partial y_{m}} \end{pmatrix}$$

Further, we need a definition of divergence

$$\operatorname{div}_{y} H = \begin{pmatrix} \sum_{i=1}^{m} \frac{\partial h_{1,i}}{\partial y_{i}} \\ \vdots \\ \sum_{i=1}^{m} \frac{\partial h_{n,i}}{\partial y_{i}} \end{pmatrix}, \quad \operatorname{and} \quad \operatorname{div}_{y}^{T} H = \left(\sum_{i=1}^{m} \frac{\partial h_{1,i}}{\partial y_{i}}, \dots, \sum_{i=1}^{m} \frac{\partial h_{n,i}}{\partial y_{i}} \right),$$

for the matrix

$$H = \begin{pmatrix} h_{1,1}, \dots, h_{1,m} \\ \vdots \\ h_{n,1}, \dots, h_{n,m} \end{pmatrix}.$$

We define

$$\begin{split} \mu(x) &= \{ y \in R^m : f(x, y) \le 0 \} \stackrel{\text{def}}{=} \{ y \in R^m : f_l(x, y) \le 0 , \ 1 \le l \le k \} , \\ \mu_{\epsilon}(x) &= \{ y \in R^m : f(x, y) \le \epsilon \} \stackrel{\text{def}}{=} \{ y \in R^m : f_l(x, y) \le \epsilon_l , \ 1 \le l \le k \} , \\ \epsilon &= (\epsilon_1, \dots, \epsilon_k) , \end{split}$$

and $\partial \mu(x)$ to be the surface of the set $\mu(x)$. We denote by $\partial_i \mu(x)$ a part of the surface which corresponds to the function $f_i(x, y)$

$$\partial_i \mu(x) = \mu(x) \bigcap \{ y \in R^m : f_i(x,y) = 0 \},$$

and

$$\partial_{l,k}\mu(x) = \bigcup_{l\leq i\leq k} \partial_i\mu(x).$$

For $y \in \partial \mu(x)$, we define

$$I(x,y) = \{ i : f_i(x,y) = 0 \},\$$

$$i(x,y) = \min_{j \in I(x,y)} j \; .$$

Let us denote by $x \times \mu_{\epsilon}(x)$, the Cartesian product of the point x and the set $\mu_{\epsilon}(x)$. Let $V(x_0)$ be some open neighborhood of the point x_0 and

$$G_{V,\epsilon}(x) = \bigcup_{x \in V(x)} (x \times \mu_{\epsilon}(x)).$$

If we split the set $K \stackrel{\text{def}}{=} \{1, \ldots, k\}$ into two subsets K_1 and K_2 , without loss of generality we can consider

$$K_1 = \{1, \ldots, l\}$$
 and $K_2 = \{l+1, \ldots, k\}$.

Now we formulate a theorem about differentiation of integral (1).

Theorem 2.1 Let us assume that the following conditions are satisfied:

- 1. the set $G_{V,\epsilon}(x_0)$ is bounded for some $V(x_0)$ and $\epsilon = (\epsilon_1, \ldots, \epsilon_k)$; $\epsilon_i > 0$, $i = 1, \ldots, k$;
- 2. the function $f : \mathbb{R}^n \times \mathbb{R}^m \to \mathbb{R}^k$ has continuous partial derivatives $\nabla_x f(x, y), \nabla_y f(x, y),$ $\nabla_{xy} f(x, y), \nabla_{yy} f(x, y)$ on the set $G_{V,\epsilon}(x_0)$;
- the function p : Rⁿ × R^m → R has continuous partial derivatives ∇_xp(x, y), ∇_yp(x, y) on the set G_{V,ϵ}(x₀);
- 4. there exists a matrix function $H_{1,l}: \mathbb{R}^n \times \mathbb{R}^m \to \mathbb{R}^n \times \mathbb{R}^m$ satisfying the equation:

$$H_{1,l}(x,y)\nabla_y f_{1,l}(x,y) + \nabla_x f_{1,l}(x,y) = 0$$
(3)

on the set $G_{V,\epsilon}(x_0)$;

- 5. the matrix function $H_{1,l}(x, y)$ has a continuous partial derivative $\nabla_y H_{1,l}(x, y)$ on the set $G_{V,\epsilon}(x_0)$;
- 6. there exist continuous matrix functions $H_i : \mathbb{R}^n \times \mathbb{R}^m \to \mathbb{R}^n \times \mathbb{R}^m$, i = l + 1, ..., ksatisfying the equations:

$$H_{i}(x,y) \nabla_{y} f_{i}(x,y) + \nabla_{x} f_{i}(x,y) = 0 , \quad i = l+1, \dots, k , \qquad (4)$$

on the set $G_{V,\epsilon}(x_0)$;

7. if the set ∂_iµ(x₀) is not empty then the gradient ∇_y f_i(x₀, y) is not equal to zero on ∂_iµ(x₀)
i.e.

$$\min_{\boldsymbol{y}\in\partial\mu(\boldsymbol{x}_0)} \min_{\boldsymbol{i}\in I(\boldsymbol{x}_0,\boldsymbol{y})} \|\nabla_{\boldsymbol{y}}f_{\boldsymbol{i}}(\boldsymbol{x}_0,\boldsymbol{y})\| \geq \gamma > 0 ; \qquad (5)$$

8. for all $y \in \partial \mu(x_0)$ the vectors $\nabla_y f_i(x_0, y)$, $i \in I(x_0, y)$ are linearly independent.

Then the function F(x), given by formula (1) is differentiable at the point x_0 and the gradient is equal to

$$\nabla_{x} F(x_{0}) = \int_{\mu(x_{0})} \left[\nabla_{x} p(x_{0}, y) + \operatorname{div}_{y} (p(x_{0}, y) H_{1,l}(x_{0}, y)) \right] dy + \int_{\partial_{l+1,k} \mu(x_{0})} p(x_{0}, y) \left[H_{i(x_{0}, y)}(x_{0}, y) - H_{1,l}(x_{0}, y) \right] \nabla_{y}^{N} f_{i(x_{0}, y)}(x_{0}, y) dS .$$
(6)

Proof. Prior to proving the theorem, we prove the following lemma.

Lemma 2.1 If a function $r: R \to R^k$ satisfies the condition

$$r(||\Delta x||)/||\Delta x|| \rightarrow 0$$
, $||\Delta x|| \rightarrow 0$,

then for sufficiently small $||\Delta x||$ the inequality

$$\left| \int_{\mu_{r(||\Delta x||)}(x_0 + \Delta x)} p(x_0 + \Delta x, y) \, \mathrm{d}y - \int_{\mu(x_0 + \Delta x)} p(x_0 + \Delta x, y) \, \mathrm{d}y \right| \leq T \sum_{i=1}^k |r_i(||\Delta x||)|,$$

holds, where T is a constant.

Proof. The sets

$$(x_0 + \Delta x) \times \mu(x_0 + \Delta x)$$
 and $(x_0 + \Delta x) \times \mu_r(||\Delta x||)(x_0 + \Delta x)$

belong to the set $G_{V,\epsilon}(x_0)$, if $||\Delta x||$ is small enough. Since the set $G_{V,\epsilon}(x_0)$ is bounded, then without loss of generality we can consider that the continuous function p(x, y) is bounded on $G_{V,\epsilon}(x_0)$. Consequently, the value

$$p(x_0 + \Delta x, y)$$
, for $y \in \mu(x_0 + \Delta x)$, $y \in \mu_{r(||\Delta x||)}(x_0 + \Delta x)$

is bounded for sufficiently small $||\Delta x||$.

Let $A_1, A_2 \subset \mathbb{R}^m$ and denote by $A_1 \Delta A_2$ a symmetric difference of the sets A_1 and A_2

 $A_1 \Delta A_2 \stackrel{\text{def}}{=} (A_1 \setminus A_2) \bigcup (A_2 \setminus A_1).$

For a set $A \in \mathbb{R}^m$ denote by q(A) the Lebesgue measure in \mathbb{R}^m . Since the value

$$p(x_0 + \Delta x, y)$$
, for $y \in \left(\mu(x_0 + \Delta x) \Delta \mu_{r(||\Delta x||)}(x_0 + \Delta x)\right)$

is bounded for sufficiently small $||\Delta x||$, the statement of the lemma follows from the inequality

$$q\left(\mu(x_{0} + \Delta x) \Delta \mu_{r(||\Delta x||)}(x_{0} + \Delta x)\right) \leq T_{1} \sum_{i=1}^{k} |r_{i}(||\Delta x||)|, \qquad (7)$$

 $T_1 = \text{const}$.

Let us prove inequality (7). Denote

$$|r(||\Delta x||)| = \left(|r_1(||\Delta x||)|, \ldots, |r_k(||\Delta x||)|\right).$$

Since

$$\mu_{-|r(||\Delta x||)|}(x_0 + \Delta x) \subset \mu(x_0 + \Delta x), \quad \mu_{-|r(||\Delta x||)|}(x_0 + \Delta x) \subset \mu_{r(||\Delta x||)}(x_0 + \Delta x),$$

and

$$\mu(x_0 + \Delta x) \subset \mu_{|r(||\Delta x||)|}(x_0 + \Delta x), \quad \mu_{r(||\Delta x||)}(x_0 + \Delta x) \subset \mu_{|r(||\Delta x||)|}(x_0 + \Delta x),$$

then

$$\left(\mu(x_0 + \Delta x) \Delta \mu_{\tau(||\Delta x||)}(x_0 + \Delta x)\right) \subset \left(\mu_{|\tau(||\Delta x||)|}(x_0 + \Delta x) \setminus \mu_{-|\tau(||\Delta x||)|}(x_0 + \Delta x)\right).(8)$$

We define a layer $D^i_{\delta}(x)$ as follows

$$D^i_{\delta}(x) = \{ y \in R^m : -\delta \leq f_i(x, y) \leq \delta \}.$$

Further, we can write

$$\left(\mu_{|r(||\Delta x||)|}(x_0 + \Delta x) \setminus \mu_{-|r(||\Delta x||)|}(x_0 + \Delta x) \right) \subset$$

$$\bigcup_{i=1}^{k} \left(\mu_{|r(||\Delta x||)|}(x_0 + \Delta x) \bigcap D^{i}_{|r_i(||\Delta x||)|}(x_0 + \Delta x) \right) .$$

$$(9)$$

Conditions 1, 2 and 7 of the theorem imply that the thickness of the layer $D^i_{|r_i(||\Delta x||)|}(x_0 + \Delta x)$ is less than $6\gamma^{-1}|r_i(||\Delta x||)|$. Indeed, it follows from conditions 1, 2 and 7 of the theorem that

$$||
abla f_i(x_0 + \Delta x, y)|| \ge 2^{-1} \gamma \quad ext{for} \quad y \in \partial \mu_i(x_0 + \Delta x) \;,$$

and sufficiently small $||\Delta x||$. Consequently, with Taylor's theorem

$$\begin{split} f_i \Big(x_0 + \Delta x, y + 3\gamma^{-1} |r_i(||\Delta x||)| \nabla_y^N f_i(x_0 + \Delta x, y) \Big) &= \\ f_i(x_0 + \Delta x, y) + 3\gamma^{-1} |r_i(||\Delta x||)| \langle \nabla_y^N f_i(x_0 + \Delta x, y), \nabla_y f_i(x_0 + \Delta x, y) \rangle + \\ o \left(r_i(||\Delta x||) \right) &\geq f_i(x_0 + \Delta x, y) + 3\gamma^{-1} |r_i(||\Delta x||)| 2^{-1}\gamma + o \left(r_i(||\Delta x||) \right) > \\ f_i(x_0 + \Delta x, y) + |r_i(||\Delta x||)| \,, \end{split}$$

for $y \in \partial \mu_i(x_0 + \Delta x)$ and sufficiently small $||\Delta x||$. It means that point $y + 3\gamma^{-1}|r_i(||\Delta x||)|$ is out of the layer

$$D^i_{|r_i(||\Delta x||)|}(x_0 + \Delta x)$$
 for $y \in \partial \mu_i(x_0 + \Delta x)$.

Analogously, the point $y - 3\gamma^{-1}|r_i(||\Delta x||)|$ is out of the layer

$$D^i_{|r_i(||\Delta x||)|}(x_0 + \Delta x)$$
 for $y \in \partial \mu_i(x_0 + \Delta x)$.

Thus, thickness of the layer $D^i_{|r_i(||\Delta x||)|}(x_0 + \Delta x)$ is less than $6\gamma^{-1}|r_i(||\Delta x||)|$. Consequently, there exist a constant T_1 such that

$$q\left(\mu_{|r(||\Delta x||)|}(x_0 + \Delta x) \bigcap D^i_{|r_i(||\Delta x||)|}(x_0 + \Delta x)\right) \leq T_1|r_i(||\Delta x||)|.$$
(10)

Inclusions (8), (9) and inequality (10) imply

$$q\left(\mu(x_0 + \Delta x) \Delta \mu_{r(||\Delta x||)}(x_0 + \Delta x)\right) \leq$$

$$q\left(\mu_{|r(||\Delta x||)|}(x_{0} + \Delta x) \setminus \mu_{-|r(||\Delta x||)|}(x_{0} + \Delta x)\right) \leq q\left(\bigcup_{i=1}^{k} \left(\mu_{|r(||\Delta x||)|}(x_{0} + \Delta x) \bigcap D_{|r_{i}(||\Delta x||)|}^{i}(x_{0} + \Delta x)\right)\right) \leq \sum_{i=1}^{k} q\left(\mu_{|r(||\Delta x||)|}(x_{0} + \Delta x) \bigcap D_{|r_{i}(||\Delta x||)|}^{i}(x_{0} + \Delta x)\right) \leq T_{1}\sum_{i=1}^{k} |r_{i}(||\Delta x||)|.$$

The lemma is proved.

Let us make an increment Δx in the argument of the function $F(x_0)$

$$F(x_0 + \Delta x) = \int_{f(x_0 + \Delta x, y) \leq 0} p(x_0 + \Delta x, y) \, \mathrm{d}y \,,$$

and make a change of variables

$$y = z + H_{1,l}^T(x_0, z) \Delta x .$$
(11)

Taylor's theorem implies that

$$f(x_{0} + \Delta x, y) = f(x_{0} + \Delta x, z + H_{1,l}^{T}(x_{0}, z)\Delta x) =$$

$$f(x_{0}, z) + \nabla_{x}^{T} f(x_{0}, z)\Delta x + \nabla_{z}^{T} f(x_{0}, z)H_{1,l}^{T}(x_{0}, z)\Delta x + o(\|\Delta x\|), \qquad (12)$$

where $o(\|\Delta x\|) / \|\Delta x\| \to 0$ as $\|\Delta x\| \to 0$. Since the set $G_{V,\epsilon}(x_0)$ is bounded, we can assume without loss of generality that functions

$$f(x,z)$$
, $\nabla_x f(x,z)$, $\nabla_z f(x,z)$, $H_{1,l}(x,z)$

are uniformly continuous on $G_{V,\epsilon}(x_0)$ (see conditions 1, 2 and 5 of Theorem 2.1). Consequently,

$$o\left(\left\|\Delta x\right\|\right)/\left\|\Delta x\right\|\to 0$$

uniformly with respect to $(x_0 + \Delta x) \times z \in G_{V,\epsilon}(x_0)$.

Denote by $J(x_0, z)$ the determinant of the Jacobian for the mapping y(z). With Lemma 2.1 and equations (11), (12) we have

$$F(x_{0} + \Delta x) = \int_{f(x_{0} + \Delta x, y) \leq 0} p(x_{0} + \Delta x, y) \, dy =$$

$$\int_{f(x_{0} + \Delta x, y) - o(||\Delta x||) \leq 0} p(x_{0} + \Delta x, y) \, dy + o(||\Delta x||) =$$

$$\int_{f(x_{0}, z) + \nabla_{x}^{T} f(x_{0}, z) \Delta x +} p(x_{0} + \Delta x, z + H_{1,l}^{T}(x_{0}, z) \Delta x) J(x_{0}, z) \, dz + o(||\Delta x||).$$
(13)
$$\int_{T} f(x_{0}, z) + \nabla_{x}^{T} f(x_{0}, z) \Delta x + dz \leq 0$$

Let us compute the determinant $J(x_0, z)$

$$J(x_{0}, z) = \left| \nabla_{z}^{T} y(z) \right| = |E + \nabla_{z}^{T} H_{1,l}^{T}(x_{0}, z) \Delta x| = 1 + \operatorname{div}_{z} \left(\Delta x^{T} H_{1,l}(x_{0}, z) \right) + o(||\Delta x||).$$
(14)

Furthermore,

$$p(x_{0} + \Delta x, z + H_{1,l}^{T}(x_{0}, z)\Delta x) J(x_{0}, z) = \left[p(x_{0}, z) + \nabla_{x}^{T} p(x_{0}, z)\Delta x + \nabla_{z}^{T} p(x_{0}, z)H_{1,l}^{T}(x_{0}, z)\Delta x + o(\|\Delta x\|) \right] \times \times \left[1 + \operatorname{div}_{z} \left(\Delta x^{T} H_{1,l}(x_{0}, z) \right) + o(\|\Delta x\|) \right] = p(x_{0}, z) + \left[\nabla_{x}^{T} p(x_{0}, z) + \nabla_{z}^{T} p(x_{0}, z)H_{1,l}^{T}(x_{0}, z) + p(x_{0}, z)\operatorname{div}_{z}^{T} H_{1,l}(x_{0}, z) \right] \Delta x + + o(\|\Delta x\|) = p(x_{0}, z) + \left[\nabla_{x}^{T} p(x_{0}, z) + \operatorname{div}_{z}^{T} \left(p(x_{0}, z)H_{1,l}(x_{0}, z) \right) \right] \Delta x + o(\|\Delta x\|) ,$$
(15)

where $o(\|\Delta x\|) / \|\Delta x\| \to 0$ as $\|\Delta x\| \to 0$. Since the set $G_{V,\epsilon}(x_0)$ is bounded, we can assume without loss of generality that functions

$$p(x,z), \nabla_x p(x,z), \nabla_z p(x,z), H_{1,l}(x,z), \nabla_z H_{1,l}(x,z)$$

are uniformly continuous and bounded on $G_{V,\epsilon}(x_0)$ (see conditions 1, 3 and 5 of Theorem 2.1). Consequently, for the term $o(\|\Delta x\|)$ in formula (15) the convergence

$$o\left(\left\|\Delta x\right\|\right) / \left\|\Delta x\right\| \to 0 \tag{16}$$

is uniform with respect to $(x_0 + \Delta x) \times z \in G_{V,\epsilon}(x_0)$.

With (13) and (15) we have

$$F(x_{0} + \Delta x) = o(\|\Delta x\|) + \int_{\substack{f(x_{0}, z) + \nabla_{x}^{T} f(x_{0}, z) \Delta x + \\ + \nabla_{x}^{T} f(x_{0}, z) H_{1,l}^{T}(x_{0}, z) \Delta x \leq 0}} o(\|\Delta x\|) dz + \int_{\substack{f(x_{0}, z) + \nabla_{x}^{T} f(x_{0}, z) H_{1,l}^{T}(x_{0}, z) \Delta x \leq 0}} \int \left\{ p(x_{0}, z) + \left[\nabla_{x}^{T} p(x_{0}, z) + \operatorname{div}_{z}^{T} \left(p(x_{0}, z) H_{1,l}(x_{0}, z) \right) \right] \Delta x \right\} dz .$$
(17)
$$\int_{\substack{f(x_{0}, z) + \nabla_{x}^{T} f(x_{0}, z) \Delta x + \\ + \nabla_{x}^{T} f(x_{0}, z) H_{1,l}^{T}(x_{0}, z) \Delta x \leq 0}}$$

Condition 1 of Theorem 2.1 and uniform convergence (16) imply

$$\int_{\substack{f(x_0,z)+\nabla_x^T f(x_0,z)\Delta x+\\+\nabla_x^T f(x_0,z)H_{1,l}^T(x_0,z)\Delta x \leq 0}} o\left(\left\| \Delta x \right\| \right) dz = o\left(\left\| \Delta x \right\| \right).$$
(18)

Combining (17) and (18) we have

$$F(x_{0} + \Delta x) = o(\|\Delta x\|) + \int_{f(x_{0},z) + \nabla_{x}^{T}f(x_{0},z)\Delta x} \left\{ p(x_{0},z) + \left[\nabla_{x}^{T}p(x_{0},z) + \operatorname{div}_{z}^{T}(p(x_{0},z)H_{1,l}(x_{0},z)) \right] \Delta x \right\} dz, \quad (19)$$

$$f(x_{0},z) + \nabla_{x}^{T}f(x_{0},z)\Delta x + + \nabla_{x}^{T}f(x_{0},z)H_{1,l}(x_{0},z)\Delta x \leq 0$$

where $o(\|\Delta x\|)/\|\Delta x\| \to 0$ as $\|\Delta x\| \to 0$. Equations (3) and (4) imply

$$\{z \in R^{m} : f(x_{0}, z) + \nabla_{x}^{T} f(x_{0}, z) \Delta x + \nabla_{z}^{T} f(x_{0}, z) H_{1,l}^{T}(x_{0}, z) \Delta x \leq 0\} = \{z \in R^{m} : f_{1,l}(x_{0}, z) \leq 0; \\ f_{i}(x_{0}, z) + \nabla_{x}^{T} f_{i}(x_{0}, z) \Delta x + \nabla_{z}^{T} f_{i}(x_{0}, z) H_{1,l}^{T}(x_{0}, z) \Delta x \leq 0, i = l + 1, ..., k\} = \{z \in R^{m} : f_{1,l}(x_{0}, z) \leq 0; \\ f_{i}(x_{0}, z) + \nabla_{z}^{T} f_{i}(x_{0}, z) \left(-H_{i}^{T}(x_{0}, z) + H_{1,l}^{T}(x_{0}, z)\right) \Delta x \leq 0, i = l + 1, ..., k\}.$$
(20)

Combining (19) and (20), we obtain

$$F(x_{0} + \Delta x) - o\left(\|\Delta x\| \right) = \int_{\substack{f_{1,l}(x_{0},z) \leq 0, \\ f_{l}(x_{0},z) + \\ f_{l}(x_{0},z) + \\ f_{l}(x_{0},z) + \\ \nabla_{x}^{T}f_{i}(x_{0},z)(H_{1,l}^{T}(x_{0},z) - H_{l}^{T}(x_{0},z))\Delta x \leq 0, \\ i = l + 1, \dots, k} \left\{ \begin{array}{c} p(x_{0}, z) + \operatorname{div}_{z}^{T}(p(x_{0}, z)H_{1,l}(x_{0}, z)) \right] \Delta x \\ \int_{\substack{f_{1,l}(x_{0},z) \leq 0, \\ f_{l}(x_{0},z) + \\ i = l + 1, \dots, k} \end{array} \right. p(x_{0}, z) \, dz +$$

$$\left\{ \begin{array}{c} \int_{\substack{f_{1,l}(x_{0},z) > H_{l}^{T}(x_{0},z) > H_{l}^{T}(x_{0},z))\Delta x \leq 0, \\ i = l + 1, \dots, k \end{array} \right. p(x_{0}, z) + \operatorname{div}_{z}^{T}\left(p(x_{0}, z)H_{1,l}(x_{0}, z)\right)\right] \Delta x \, dz \, .$$

$$\left\{ \begin{array}{c} \nabla_{x}^{T}p(x_{0}, z) + \operatorname{div}_{z}^{T}\left(p(x_{0}, z)H_{1,l}(x_{0}, z)\right)\right\} \right\} \Delta x \, dz \, .$$

$$\left\{ \begin{array}{c} \nabla_{x}^{T}f_{i}(x_{0},z) + \\ \nabla_{x}^{T}f_{i}(x_{0},z) + H_{i}^{T}(x_{0},z) \right\} \Delta x \leq 0, \\ i = l + 1, \dots, k \end{array} \right\}$$

$$\left\{ \begin{array}{c} \nabla_{x}^{T}p(x_{0}, z) + \operatorname{div}_{z}^{T}\left(p(x_{0}, z)H_{1,l}(x_{0}, z)\right)\right\} \Delta x \, dz \, . \end{array} \right\}$$

$$\left\{ \begin{array}{c} 22 \\ \nabla_{x}^{T}f_{i}(x_{0},z) + H_{i}^{T}(x_{0},z) \right\} \Delta x \leq 0, \\ i = l + 1, \dots, k \end{array} \right\}$$

Now we need the following lemma.

Lemma 2.2 If a function $r: R \to R^k$ satisfies the condition

 $r(||\Delta x||) \rightarrow 0$, $||\Delta x|| \rightarrow 0$,

then for sufficiently small $||\Delta x||$ the inequality

$$\int_{\mu_{\tau}(||\Delta x||)(x_0)} \left[\nabla_x^T p(x_0, z) + \operatorname{div}_z^T \left(p(x_0, z) H_{1,l}(x_0, z) \right) \right] \Delta x \, \mathrm{d}z -$$

$$\int_{\mu(x_0)} \left[\nabla_x^T p(x_0, z) + \operatorname{div}_z^T \left(p(x_0, z) H_{1,l}(x_0, z) \right) \right] \Delta x \, \mathrm{d}z \, \left| \leq T ||\Delta x|| \sum_{i=1}^k |r_i(||\Delta x||)| \right.$$

holds, where T is a constant.

Proof. This lemma can be proved analogously to Lemma 2.1. Since the set $G_{V,\epsilon}(x_0)$ is bounded, conditions 2, 3, 5 of Theorem 2.1 imply

$$\left[\nabla_x^T p(x_0, z) + \operatorname{div}_z^T \left(p(x_0, z) H_{1,l}(x_0, z) \right) \right] \Delta x \leq C \|\Delta x\|, \quad C = \operatorname{const},$$
(23)

Analogously to inequality (7) we can prove

$$q(\mu(x_0) \Delta \mu_{r(||\Delta x||)}(x_0)) \leq C_1 \sum_{i=1}^k |r_i(||\Delta x||)|, \quad C_1 = \text{const}.$$
(24)

The statement of the lemma follows from inequalities (23) and (24).

Since the set $G_{V,\epsilon}(x_0)$ is bounded, the conditions 2, 5, 6 of Theorem 2.1 imply

$$\nabla_{z}^{T} f_{i}(x_{0}, z) \Big(H_{1,l}^{T}(x_{0}, z) - H_{i}^{T}(x_{0}, z) \Big) \Delta x \leq C_{2} \|\Delta x\|, \quad i = l + 1, \dots, k , \qquad (25)$$

$$C_{2} = \text{const} ,$$

for $(x_0 + \Delta x) \times z \in G_{V,\epsilon}(x_0)$.

Thus, with (25) and Lemma 2.2 for integral (22) we have

$$\int_{\substack{f_{1,l}(x_{0},z) \leq 0, \\ f_{i}(x_{0},z) + \\ \nabla_{x}^{T}f_{i}(x_{0},z) + \\ \nabla_{x}^{T}f_{i}(x_{0},z)(H_{1,l}^{T}(x_{0},z) - H_{i}^{T}(x_{0},z))\Delta x \leq 0, \\ i = l+1, \dots, k} \int_{\substack{\mu(x_{0})}} \left[\nabla_{x}^{T}p(x_{0},z) + \operatorname{div}_{z}^{T} \left(p(x_{0},z)H_{1,l}(x_{0},z) \right) \right] \Delta x \, \mathrm{d}z + o\left(\left\| \Delta x \right\| \right),$$
(26)

where $o(\|\Delta x\|) / \|\Delta x\| \to 0$ as $\|\Delta x\| \to 0$. Let us rewrite integral (21) in the following way

$$\int p(x_0, z) dz =$$

$$\int f_{1,l}(x_0, z) \leq 0,$$

$$f_i(x_0, z) +$$

$$\nabla_x^T f_i(x_0, z) (H_{1,l}^T(x_0, z) - H_i^T(x_0, z)) \Delta x \leq 0,$$

$$i = l+1, \dots, k$$

$$F(x_0) + \int p(x_0, z) dz - \int p(x_0, z) dz - \int f_{1,l}(x_0, z) dz =$$

$$\int f_{1,l}(x_0, z) \leq 0,$$

$$f_i(x_0, z) + \int f_{1,l}(x_0, z) \leq 0,$$

$$f_i(x_0, z) + \int f_{1,l}(x_0, z) \leq 0,$$

$$i = l+1, \dots, k$$

$$f_i(x_0, z) \leq 0,$$

$$i = l+1, \dots, k$$

 $F(x_0) + D.$

(27)

The difference D can be represented as a surface integral. Indeed, if

$$z \in \partial_{l+1,k}\mu(x_0) = \bigcup_{l \le i \le k} \left(\mu(x_0) \bigcap \{ y \in \mathbb{R}^m : f_i(x_0, y) = 0 \} \right) ,$$

and the surface $\partial_{l,k}\mu(x_0)$ is smooth around a point z, then condition 8 of Theorem 2.1 imply that the index set $I(x_0, z)$ consists only from one index $i(x_0, z)$. The distance between point z and a nearest point on the surface of the set

$$\{z \in \mathbb{R}^{m} : f_{1,l}(x_{0}, z) \leq 0;$$

$$f_{i}(x_{0}, z) + \nabla_{z}^{T} f_{i}(x_{0}, z) (H_{1,l}^{T}(x_{0}, z) - H_{i}^{T}(x_{0}, z)) \Delta x \leq 0, i = l + 1, \dots, k\}$$

is equal to

$$\left| \frac{\nabla_z^T f_{i(x_0,z)}(x_0,z)}{||\nabla_z^T f_{i(x_0,z)}(x_0,z)||} \left(H_{1,l}^T(x_0,z) - H_i^T(x_0,z) \right) \Delta x \right| + o(||\Delta x||) = \\ \left| \langle \left(H_{1,l}(x_0,z) - H_i(x_0,z) \right) \nabla_z^N f_{i(x_0,z)}(x_0,z), \Delta x \rangle \right| + o(||\Delta x||) .$$

Thus, the difference D of the volume integrals can be represented as an integral over a surface

$$D = \int_{\partial_{l+1,k}\mu(x_0)} \langle p(x_0, z) \left[H_{i(x_0, z)}(x_0, z) - H_{1,l}(x_0, z) \right] \nabla_z^N f_{i(x_0, z)}(x_0, z), \Delta x \rangle \, dz +$$
(28)
+ $o(\|\Delta x\|),$

where $o(\|\Delta x\|) / \|\Delta x\| \to 0$ as $\|\Delta x\| \to 0$. Combining (21), (22), (26), (27) and (28), we have

$$\begin{split} F(x_0 + \Delta x) &- F(x_0) = \Big\langle \int_{\mu(x_0)} \left[\nabla_x p(x_0, z) + \operatorname{div}_z \left(p(x_0, z) H_{1,l}(x_0, z) \right) \right] dz + \\ &+ \int_{\partial_{l+1,k} \mu(x_0)} p(x_0, z) \left[H_{i(x_0, z)}(x_0, z) - H_{1,l}(x_0, z) \right] \nabla_z^N f_{i(x_0, z)}(x_0, z) dz , \Delta x \Big\rangle + \\ &+ o \left(\left\| \Delta x \right\| \right) , \end{split}$$

where $o(\|\Delta x\|) / \|\Delta x\| \to 0$ as $\|\Delta x\| \to 0$.

The last statement proves the theorem.

3 An Example

The investigation of operational strategies for inspected components (see [6]) led us to the calculation of the gradient for the following integral function

$$F(x) = \int_{\substack{b(y) \le x, \\ y_i \ge \theta, i=1,\dots,m}} p(y) \, \mathrm{d}y \,, \tag{29}$$

where $x \in R^1$, $y \in R^m$, $p: R^m \to R^1$, $b(y) = \sum_{i=1}^m y_i^{\alpha}$, $\theta > 0$. In this case

$$f(x,y) = \begin{pmatrix} b(y) - x \\ \theta - y_1 \\ \vdots \\ \theta - y_m \end{pmatrix},$$

and

$$F(x) = \int_{f(x,y) \leq 0} p(x,y) \,\mathrm{d}y = \int_{\mu(x)} p(x,y) \,\mathrm{d}y \,.$$

Here, we consider the case of l = 1 (see, condition 4 of Theorem 2.1). Equation (3) is represented as follows

$$H_{1,1}(x,y) \nabla_y f_1(x,y) + \nabla_x f_1(x,y) = 0.$$
(30)

Since

$$abla_{\mathbf{y}}f_1(x,y) = lpha \left(egin{array}{c} y_1^{lpha-1} \ dots \ y_m^{lpha-1} \end{array}
ight) \ , \quad
abla_{\mathbf{x}}f_1(x,y) = -1 \ ,$$

then

$$H_{1,1} = h(y) \stackrel{\text{def}}{=} \left(h_1(y_1), \dots, h_m(y_m)\right) = \frac{1}{\alpha m} \left(y_1^{1-\alpha}, \dots, y_m^{1-\alpha}\right) \tag{31}$$

is a solution to equation (30). We can write equations (4) as follows

$$H_i(x,y) \nabla_y f_i(y) + \nabla_x f_i(y) = 0, \quad i = 2, ..., m+1.$$
(32)

The function $f_i(y)$ does not depend on x for $i=2,\ldots,m+1$ and $\nabla_x f_i(y)=0$. Consequently,

$$H_i(x,y) = 0, \quad i = 2, ..., m+1,$$
(33)

is a solution of the system of equations (32).

The set $\partial_{2,m+1}\mu(x)$ has a simple structure,

$$\partial_{2,m+1}\mu(x) = \bigcup_{2 \le i \le m+1} \partial_i \mu(x) = \bigcup_{2 \le i \le m+1} \left(\mu(x) \bigcap \left\{ y \in \mathbb{R}^m : y_i = \theta \right\} \right).$$
(34)

We can consider

$$\nabla_{y}^{N} f_{i(y)}(y) = e(i(y)), \quad \text{for} \quad y \in \partial_{2,m+1} \mu(x) , \qquad (35)$$

where

$$e(i(y)) = \begin{pmatrix} e_1 \\ \vdots \\ e_m \end{pmatrix},$$

$$e_j = 0 \text{ for } j \neq i(y); \quad e_j = -1 \text{ for } j = i(y),$$

$$i(y) = \min \{ j : y_j = \theta \}.$$

In view of (6), (31), (33), (34) and (35), we have

$$\begin{aligned} \nabla_x F(x) &= \int\limits_{\mu(x)} \operatorname{div}_y \left(p(y)h(y) \right) \, \mathrm{d}y \, + \int\limits_{\partial_{2,m+1}\mu(x)} p(y) \left(-h(y) \right) \nabla_y^N f_{i(y)}(y) \, \mathrm{d}S \, = \\ \int\limits_{\mu(x)} \operatorname{div}_y \left(p(y)h(y) \right) \, \mathrm{d}y \, + \, \sum_{i=1}^m \int\limits_{\partial_{i+1}\mu(x)} p(y) \left(-h(y) \right) e(i(y)) \, \mathrm{d}S \, = \\ \int\limits_{\mu(x)} \operatorname{div}_y \left(p(y)h(y) \right) \, \mathrm{d}y \, + \, \sum_{i=1}^m h_i(\theta) \int\limits_{\partial_{i+1}\mu(x)} p(y) \, \mathrm{d}S \, = \\ \int\limits_{y_i \geq \theta, i=1, \dots, m} \operatorname{div}_y \left(p(y)h(y) \right) \, \mathrm{d}y \, + \, \sum_{i=1}^m \frac{\theta^{1-\alpha}}{\alpha m} \int\limits_{\substack{b(\theta_i|y) \leq x, \\ y^{-i} \geq \theta}} p(\theta_i \mid y) \, \mathrm{d}y^{-i} \, , \end{aligned}$$

where

$$(\theta_i \mid y) = (y_1, \dots, y_{i-1}, \theta, y_{i+1}, \dots, y_m),$$

$$y^{-i} = (y_1, \dots, y_{i-1}, y_{i+1}, \dots, y_m),$$

$$b(\theta_i \mid y) = \theta^{\alpha} + \sum_{\substack{j=1 \\ j \neq i}}^m y_j^{\alpha}.$$

The inequality $y^{-i} \ge \theta$ should be treated as the set of inequalities

$$y_j \geq \theta$$
, $j = 1, \ldots, i-1, i+1, \ldots, m$.

Since

$$\operatorname{div}_{y}(p(y)h(y)) = h(y)\nabla_{y}p(y) + p(y)\operatorname{div}_{y}h(y) = \frac{1}{\alpha m}\sum_{i=1}^{m}\frac{\partial p(y)}{\partial y_{i}}y_{i}^{1-\alpha} + p(y)\frac{1-\alpha}{\alpha m}\sum_{i=1}^{m}y_{i}^{-\alpha},$$

then we finally have

$$\nabla_{x}F(x) = \int_{\substack{b(y) \leq x, \\ y_{i} \geq \theta, i=1,...,m}} \frac{1}{\alpha m} \sum_{i=1}^{m} y_{i}^{-\alpha} \left[y_{i} \frac{\partial p(y)}{\partial y_{i}} + (1-\alpha)p(y) \right] dy + \frac{\theta^{1-\alpha}}{\alpha m} \sum_{i=1}^{m} \int_{\substack{b(\theta_{i}|y) \leq x, \\ y^{-i} \geq \theta}} p(\theta_{i} \mid y) dy^{-i}.$$

The formula for the $\nabla_x F(x)$ is valid for an arbitrary sufficiently smooth function p(y).

4 Summary

We have proved a general formula for the differentiation of an integral over the volume given by many inequalities. This formula can be used in different applied areas. One important area is the optimal control of systems with very high failure costs. In this case optimization should be made under the condition that the probability of failure is sufficiently small. A probability function can be represented as an integral over a set depending upon parameters. A gradient of the integral is expressed as a sum of integrals taken over volume and over surface. These results are very useful for the calculation of parameter sensitivities and the optimization of probability functions.
